Exposed Linear Encoders for High Vacuum

LIC 4113V, LIC 4193V

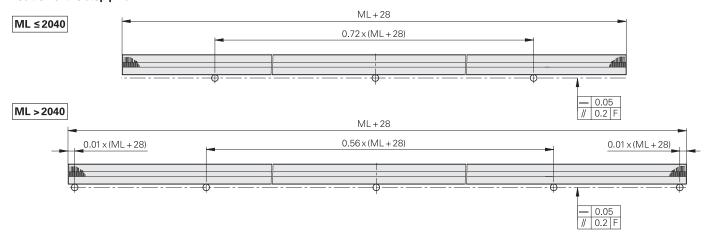

Exposed linear encoders for high vacuum applications

- Measuring lengths up to 3 m
- Measuring steps down to 0.001 µm
- Glass or glass ceramic measuring standard
- Measuring standard is secured with fixing clamps

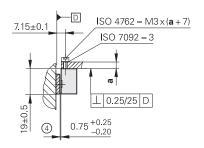

Position of the stop pins

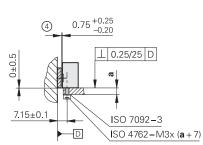

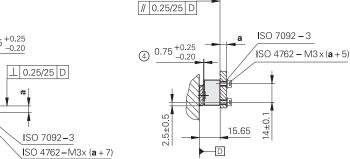

Mounting possibilities for scanning head

(shown without fixing clamps)

- = Machine guideway
- = Mounting error plus dynamic guideway error
- S = Beginning of measuring length (ML)
- © = Code start value: 100±1 mm
- ① = Linear scale length
- © = Fixed-point element for defining the thermal fixed point
- = Gap is adjusted with a spacer shim during mounting
- = Depends on measuring length (ML); use additional pair of fixing clamps
- 3 = Adhesive
- = Mounting clearance between scanning head and linear scale 4
- = Optical centerline
- = Direction of motion of the scanning unit for ascending position values

Linear scale	LIC 4003							
Measuring standard Coefficient of linear expansion*	METALLUR grating on glass ceramic or glass $\alpha_{therm} \approx 8 \cdot 10^{-6} \text{ K}^{-1} \text{ (glass)}$ $\alpha_{therm} = (0 \pm 0.5) \cdot 10^{-6} \text{ K}^{-1} \text{ (Robax glass ceramic)}$							
Accuracy grade*	±1 μm (only for Robax glass ceramic), ±3 μm, ±5 μm							
Baseline error	≤ ±0.275 µm/10 mm

Encoders for use in a vacuum

These vacuum-compatible encoders feature the following characteristics:

- Air vents
- Clean-room manufacturing
- Specialized cleaning and packaging
- Cable with PTFE insulation and tin-plated copper braiding

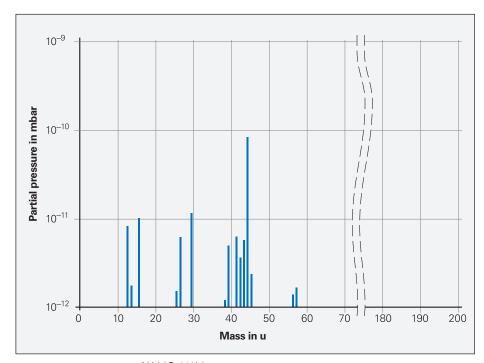

Residual gas analysis

The influence of encoders on the quality of a vacuum can be determined through residual gas analyses. In these analyses, a sample in a vacuum chamber is pumped out to at least 10⁻⁶ mbar (turbomolecular pump, pumping speed 15 l/s to 200 l/s). The residual gases are measured with a mass spectrometer (Pfeiffer QMA 200) and an absolute pressure sensor (VACOM ATMION). The outgassing behavior of the examined sample can then be deduced by subtracting the typical residual gases of the empty chamber.

The amount of remaining residual gases depends not only on the cleanliness of the sample and the tested materials, but also on the pump type used and its pumping speed. The higher the pumping speed for the measurement is, and the longer the gas is pumped out, the lower the amount of residual gases will be.

To attain the lowest possible outgassing values, HEIDENHAIN recommends baking at 100 °C for 48 hours under high vacuum conditions.

The figure shows the spectrum of the residual gas analysis of an AK LIC 411V scanning head with a 1 m cable and D-sub connector. The scanning head was baked at 100 °C in a high vacuum. The outgassing of the linear scale (with fixed-point adhesive bond) was barely measurable or depictable.

Residual gas analysis of an AK LIC 411 V scanning head with 1 m cable (pumping speed: 107 l/s, pressure: $6 \cdot 10^{-8}$ mbar)
